Shape & Cutting

Cushion

Origin

Not Specified

THE CAUSE OF COLOR IN YOUR GREENISH YELLOW DIAMOND

Yellow color in diamonds is attributed to the presence of nitrogen atoms that absorb blue light in the visible spectrum. Green diamonds derive their color from the absorption of red light waves. In your diamond, subterranean radiation exposure altered its atomic structure leading to the absorption of red light by its molecules and the emergence of its distinctive color.

A WORD ABOUT THE SATURATION OF YOUR DIAMOND

The grade '**Fancy**' represents a level with a significant presence of color and accounts for **36%** of all Greenish Yellow fancy Color diamonds.

There are Six available saturation levels in Yellow color diamonds, Fancy being the Fourth most saturated.

Light greenish-yellow

Fancy Light greenish-yellow

Fancy greenish-yellow

Fancy Intense greenish-yellow

Fancy Vivid greenish-yellow

THE FUNDAMENTALS OF THIS DIAMOND'S SHAPE

The Cushion shape dates back to the early days when diamonds were initially used to adorn royalty's crowns. Today, it remains the most popular diamond shape in fancy color jewelry. This shape also allows for a high yield from a typical rough diamond. The pavilion at the bottom of your stone possesses a distinctive facet alignment that enhances color reflection and brilliance. With a straight outline and rounded corners in the four curved areas, it retains its unique appeal. Although the GIA does not officially classify this shape as a Cushion, it is commonly referred to as one.

TRUE FACE-UP

The carat weight and physical size of a diamond are important factors in determining its value. However, when it comes to fancy colored diamonds, there is a tendency to prioritize other visual elements over their size, and as a result, the surface area of the face-up view is not always given high priority.

Diamonds that appear slightly smaller are considered to be within the norm. However, diamonds that appear larger in relation to their weight will receive a premium.

* The data in this section pertains to the relationship between your diamond's face-up dimensions and the average face-up dimensions for relevant weight categories.

The Face-up of this 1.2 carat Cushion is equivalent to that of a **1.29 - 1.31 carat** which is **~8.4% larger** than the average Cushion shape in this weight.

Large face-up commands a Premium

THE MEDIUM BLUE FLUORESCENT IN THIS DIAMOND

Fluorescence refers to the emission of visible light when a diamond is exposed to UV light. The fluorescence in this diamond is caused by the presence of trace elements within the lattice of the diamond. When a diamond is exposed to UV light, these elements absorb the energy from the UV light. They become excited, and as a result, release energy in the form of a Blue glow. The **Medium Blue** fluorescence has very little to almost no impact on the quality of this 1.2 carat diamond. In order to view the fluorescent glow, one must use a special UV device.

HOW RARE IS THIS 1.20 CARAT?

- Only **1 in ~ 57,000** diamonds will have similar characteristics
- A mere **31 to 39** similar diamonds enter the market yearly

RARITY GRADE
EXTRAORDINARY

The data on the Fancy Color Diamond Diary© may change from time to time and is not a guarantee or a reflection of the diamond's value. The origin of the diamond is provided solely according to the input of the person for whom the report was produced. The gemological description of the diamond is obtained from the GIA website. To maintain the accuracy and currency of the information, it is advised to periodically update the diary, especially prior to each use. For additional information about the data and other limitations, please contact us at customers@fcresearch.org.
