Shape & Cutting

Cushion

Origin

Not Specified

THE CAUSE OF COLOR IN YOUR YELLOWISH GREEN DIAMOND

Yellow color in diamonds is attributed to the presence of nitrogen atoms that absorb blue light in the visible spectrum. Green diamonds derive their color from the absorption of red light waves. In your diamond, subterranean radiation exposure altered its atomic structure leading to the absorption of red light by its molecules and the emergence of its distinctive color.

A WORD ABOUT THE SATURATION OF YOUR DIAMOND

The grade **"Intense"** is the Sixth strongest saturation on the scale and represents **19%** of all Yellowish Green diamonds. Those graded as "Intense" Yellowish Green exhibit powerful saturation and convey a strong color sensation.

There are Seven available saturation levels in Green color diamonds, Fancy Intense being the Sixth most saturated.

Faint yellow-green

Very Light yellow-green

Light yellow-green

Fancy Light yellow-green

Fancy yellow-green

Fancy Intense yellow-green

Fancy Vivid yellow-green

THE FUNDAMENTALS OF THIS DIAMOND'S SHAPE

The **Cushion** shape dates back to the early days when diamonds were initially made to decorate crowns of royalty. Today, the Cushion shape is still the most popular jewelry shape, and it is also yields the highest possible weight from rough diamonds. The pavilion on the bottom of your stone has a Starburst facet alignment to reinforce color reflection and brilliance. **30%** from all Yellowish Green fancy color diamonds are polished as Cushion / Radiant.

TRUE FACE-UP

The carat weight and physical size of a diamond are important factors in determining its value. However, when it comes to fancy colored diamonds, there is a tendency to prioritize other visual elements over their size, and as a result, the surface area of the face-up view is not always given high priority. Diamonds that appear slightly smaller are considered to be within the norm. However, diamonds that appear larger in relation to their weight will receive a premium.

* The data in this section pertains to the relationship between your diamond's face-up dimensions and the average face-up dimensions for relevant weight categories.

The Diamond's face-up view appears true to its carat weight.

THE VERY STRONG GREEN FLUORESCENT IN THIS DIAMOND

Fluorescence refers to the emission of visible light when a diamond is exposed to UV light. The fluorescence of this diamond is caused by the presence of trace elements within the lattice of the diamond. When a diamond is exposed to UV light, these elements absorb energy from the UV light. They become excited, and as a result, release energy in the form of a green glow. **Green fluorescence** reinforces the color of this Yellowish Green diamond and will entail a price premium. The stronger the green fluorescence, the more attractive the diamond will be.

HOW RARE IS THIS 1.34 CARAT?

- Only **1 in ~ 310,000** diamonds will have similar characteristics
- A mere **4 to 9** similar diamonds enter the market yearly
